23: Dirichlet Process Models

Taylor

University of Virginia

Introduction

We'll take a look at **Dirichlet Processes** now, and see how they're useful for mixture modeling.

Taylor (UVA) "23" 2 / 16

A probability model for the density analagous to the histogram

$$f(y \mid \pi_1, \dots, \pi_k) = \sum_{h=1}^k 1_{\xi_{h-1} < y \le \xi_h} \frac{\pi_h}{(\xi_h - \xi_{h-1})}$$

where $\xi_0 < \xi_1 < \cdots < \xi_k$ are your **knot points**, and (π_1, \dots, π_k) is an unknown probability vector.

Taylor (UVA) "23" 3 / 16

A probability model for the density analagous to the histogram

$$f(y \mid \pi_1, \dots, \pi_k) = \sum_{h=1}^k 1_{\xi_{h-1} < y \le \xi_h} \frac{\pi_h}{(\xi_h - \xi_{h-1})}$$

where $\xi_0 < \xi_1 < \cdots < \xi_k$ are your **knot points**, and (π_1, \dots, π_k) is an unknown probability vector.

Note

$$\int f(y) dy = \sum_{h=1}^{k} \mathsf{base}_{h} \times \mathsf{height}_{h} = \sum_{h=1}^{k} (\xi_{h} - \xi_{h-1}) \frac{\pi_{h}}{(\xi_{h} - \xi_{h-1})} = 1.$$

Taylor (UVA) "23" 3 / 16

$$f(y \mid \pi) = \sum_{h=1}^{k} 1_{\xi_{h-1} < y \le \xi_h} \frac{\pi_h}{(\xi_h - \xi_{h-1})}$$

We can put a Dirichlet $(\alpha_1, \ldots, \alpha_k)$ prior on the parameters $\pi = (\pi_1, \ldots, \pi_k)$:

$$p(\pi) = \frac{\Gamma\left(\sum_{h=1}^{k} a_h\right)}{\prod_{h=1}^{k} \Gamma(\alpha_h)} \prod_{h=1}^{k} \pi_h^{a_h - 1}$$

where $a = (a_1, \dots, a_k)$ are the chosen parameters of the prior.

Taylor (UVA) "23" 4/1

Note that $f(y \mid \pi)$ was for one data point y. Let $\sigma(i) = \{k : \xi_{k-1} < y_i \le \xi_k\}$. Notice that this function is many-to-one. Then

$$p(y \mid \pi) = \prod_{i=1}^{n} f(y_i \mid \pi)$$

$$= \prod_{i=1}^{n} \left[\sum_{h=1}^{k} 1_{\xi_{h-1} < y_i \le \xi_h} \frac{\pi_h}{(\xi_h - \xi_{h-1})} \right]$$

$$= \prod_{i=1}^{n} \left[\frac{\pi_{\sigma(i)}}{(\xi_{\sigma(i)} - \xi_{\sigma(i)-1})} \right]$$

$$= \prod_{h=1}^{k} \left[\frac{\pi_h}{(\xi_h - \xi_{h-1})} \right]^{n_h}$$

where $n_h = \sum_{i=1}^{n} 1_{\xi_{h-1} < y_i \le \xi_h}$.

4日 → 4日 → 4 目 → 4 目 → 9 Q ○

Bayes' rule:

$$p(\pi \mid y) \propto p(y \mid \pi)p(\pi)$$

$$= \left[\prod_{h=1}^{k} \left(\frac{\pi_h}{(\xi_h - \xi_{h-1})}\right)^{n_h}\right] \prod_{h=1}^{k} \pi_h^{a_h - 1}$$

$$\propto \prod_{h=1}^{k} \pi_h^{a_h + n_h - 1}$$

So $p(\pi \mid y) = Dirichlet(a_1 + n_1, \dots, a_k + n_k).$

Taylor (UVA) "23" 6/16

Bayes' rule:

$$p(\pi \mid y) \propto p(y \mid \pi)p(\pi)$$

$$= \left[\prod_{h=1}^{k} \left(\frac{\pi_h}{(\xi_h - \xi_{h-1})}\right)^{n_h}\right] \prod_{h=1}^{k} \pi_h^{a_h - 1}$$

$$\propto \prod_{h=1}^{k} \pi_h^{a_h + n_h - 1}$$

So
$$p(\pi \mid y) = Dirichlet(a_1 + n_1, \dots, a_k + n_k).$$

But bin specification is annoying!

Taylor (UVA) "23" 6/16

A quick note

If $\pi \sim \text{Dirichlet}(a_1, \ldots, a_k)$ then

$$E[\pi] = \left(\frac{a_1}{\alpha}, \cdots, \frac{a_k}{\alpha}\right)$$

where

$$\alpha = a_1 + \cdots + a_k$$
.

So we can write

$$\pi \sim \mathsf{Dirichlet}(\alpha E[\pi])$$

as well. α has the interpretation of a sample size.

Taylor (UVA) "23" 7/1

Definitions

A **random probability measure** assigns probabilities to sets, and they still satisfy the three probability axioms, but these probabilities are random.

Taylor (UVA) "23" 8 / 16

Definitions

A **random probability measure** assigns probabilities to sets, and they still satisfy the three probability axioms, but these probabilities are random.

The random probability measure P is a **Dirichlet process** if for **any** measurable partition B_1, \ldots, B_k of a sample space Ω , the vector

$$P(B_1), \ldots, P(B_k) \sim \text{Dirichlet}(\alpha P_0(B_1), \ldots, \alpha P_0(B_k)).$$

Taylor (UVA) "23" 8/16

Definitions

- \bullet \bullet P₀ is a **baseline probability measure** we pick (e.g. normal)
- **2** shorthand: $P \sim \mathsf{DP}(\alpha P_0)$
- **③** P(B) ∼ Beta $(\alpha P_0(B), \alpha (1 P_0(B)))$ for any measurable B
- $E[P(B)] = P_0(B)$
- $V[P(B)] = P_0(B)[1 P_0(B)]/(1 + \alpha)$

Taylor (UVA) "23" 9 / 16

Assume $y_i \stackrel{iid}{\sim} P$ and $P \sim \mathsf{DP}(\alpha P_0)$. Then, for any partition B_1, \ldots, B_k ,

$$\begin{split} & P(B_1), \dots, P(B_k) \mid y_1, \dots, y_n \\ & \sim \mathsf{Dirichlet}\left(\alpha P_0(B_1) + \sum_{i=1}^n 1_{y_i \in B_1}, \dots, \alpha P_0(B_k) + \sum_{i=1}^n 1_{y_i \in B_k}\right) \end{split}$$

using the same reasoning as in slide 5.

Taylor (UVA) "23" 10 / 16

Assume $y_i \stackrel{iid}{\sim} P$ and $P \sim \mathsf{DP}(\alpha P_0)$. Then, for any partition B_1, \ldots, B_k ,

$$\begin{split} & P(B_1), \dots, P(B_k) \mid y_1, \dots, y_n \\ & \sim \mathsf{Dirichlet}\left(\alpha P_0(B_1) + \sum_{i=1}^n 1_{y_i \in B_1}, \dots, \alpha P_0(B_k) + \sum_{i=1}^n 1_{y_i \in B_k}\right) \end{split}$$

using the same reasoning as in slide 5.

What happens when we take the noninformative prior $\alpha \downarrow 0$?

Taylor (UVA) "23" 10 / 16

In particular, for any measurable B, $P(B) \mid y_1, \dots, y_n$ follows a

$$\operatorname{Beta}\left(\alpha P_0(B) + \sum_{i=1}^n 1_{y_i \in B}, \alpha + n - \left[\alpha P_0(B) + \sum_{i=1}^n 1_{y_i \in B}\right]\right)$$

and

$$E[P(B) \mid y_1, \dots, y_n] = \frac{\alpha P_0(B) + \sum_{i=1}^n 1_{y_i \in B}}{\alpha + n}$$
$$= \frac{\alpha}{\alpha + n} P_0(B) + \frac{n}{\alpha + n} \sum_{i=1}^n \frac{1_{y_i \in B}}{n}$$

Taylor (UVA) "23" 11 / 16

In particular, for any measurable B, $P(B) \mid y_1, \dots, y_n$ follows a

$$\operatorname{Beta}\left(\alpha P_0(B) + \sum_{i=1}^n 1_{y_i \in B}, \alpha + n - \left[\alpha P_0(B) + \sum_{i=1}^n 1_{y_i \in B}\right]\right)$$

and

$$E[P(B) \mid y_1, \dots, y_n] = \frac{\alpha P_0(B) + \sum_{i=1}^n 1_{y_i \in B}}{\alpha + n}$$
$$= \frac{\alpha}{\alpha + n} P_0(B) + \frac{n}{\alpha + n} \sum_{i=1}^n \frac{1_{y_i \in B}}{n}$$

not "smooth" even if P_0 was!

Taylor (UVA) "23" 11 / 16

We can write a DP as a countably infinite mixture of point masses:

$$P(\cdot) = \sum_{h=1}^{\infty} \pi_h \delta_{\theta_h}(\cdot).$$

Round 1

- **1** sample location $\theta_1 \sim P_0$
- $oldsymbol{0}$ sample associated probability $V_1 \sim \mathsf{Uniform}(0,1)$
- ullet we have $1-V_1$ probability left over...

Taylor (UVA) "23" 12 / 16

We can write a DP as a countably infinite mixture of point masses:

$$P(\cdot) = \sum_{h=1}^{\infty} \pi_h \delta_{\theta_h}(\cdot).$$

Round 1

- **1** sample location $\theta_1 \sim P_0$
- 2 sample associated probability $V_1 \sim \mathsf{Uniform}(0,1)$
- ullet we have $1-V_1$ probability left over...

Round 2

- **1** sample location $\theta_2 \sim P_0$
- 2 sample $V_2 \sim \mathsf{Uniform}(0,1)$
- ullet probability at second location is now $(1-V_1)V_2$
- we have

$$1 - (V_1 + V_2(1 - V_1)) = 1 - V_1 - V_2(1 - V_1) = (1 - V_1)(1 - V_2)$$
 probability left over...

We can write a DP as a countably infinite mixture of point masses:

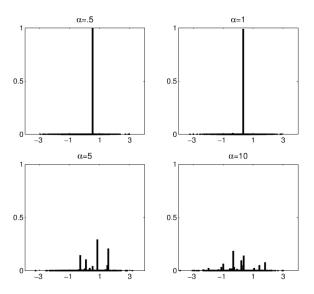

$$P(\cdot) = \sum_{h=1}^{\infty} \pi_h \delta_{\theta_h}(\cdot).$$

with

$$\pi_h = V_h \prod_{l < h} (1 - V_l)$$

and $V_h \stackrel{\text{iid}}{\sim} \text{Beta}(1, \alpha)$, $\theta_h \stackrel{\text{iid}}{\sim} P_0$

Taylor (UVA) "23" 13/16

Taylor (UVA) "23" 14 / 1

$$E[P(B)] = \sum_{h=1}^{\infty} E[\pi_h 1_{\theta_h \in B}]$$

$$= \sum_{h=1}^{\infty} E[\pi_h] E[1_{\theta_h \in B}]$$

$$= \sum_{h=1}^{\infty} E[V_h \prod_{l < h} (1 - V_l)] P_0(B)$$

$$= P_0(B) \sum_{h=1}^{\infty} E[V_h] \prod_{l < h} E[(1 - V_l)]$$

$$= P_0(B) \sum_{h=1}^{\infty} \frac{1}{1 + \alpha} \left(\frac{\alpha}{1 + \alpha}\right)^{h-1}$$

$$= P_0(B)$$

Dirichlet process mixtures

Sampling $P \sim \mathrm{DP}(\alpha P_0)$ and then using that random histogram as the distribution for a sample of continuous y_i random variables is problematic because we would like P to be smooth.

Taylor (UVA) "23" 16 / 16

Dirichlet process mixtures

Sampling $P \sim \mathrm{DP}(\alpha P_0)$ and then using that random histogram as the distribution for a sample of continuous y_i random variables is problematic because we would like P to be smooth.

We can use DPs for general kernel mixture models though:

$$f(y \mid P) = \int \mathcal{K}(y \mid \theta) P(d\theta)$$
$$= \sum_{h=1}^{\infty} \pi_h \mathcal{K}(y \mid \theta_h)$$

This is a mixture model, but there are an infinite number of mixands!

Taylor (UVA) "23" 16 / 16
